Cloud Orchestration - Use Cases in Practice

Seven use cases. Four organisations. Every use case has a home.

Lloyds Banking Group

CI/CD - Continuous Integration & Continuous Deployment

Hundreds of services. Multiple deploys every day. Every deploy is identical, tested, and automatically rolled back if it fails. Customers never see a broken release.

Without orchestration: *One typo in a config, no rollback capability - mobile banking is down. Customers call. FCA notices.*

Ofgem - UK Energy Regulator

Automated Security Compliance & Patching

Ofgem holds vulnerable consumer data and answers to the ICO. Orchestration patches every server automatically - provably compliant, always. No engineer forgetting. No drift.

Without orchestration: *An unpatched server sits exposed for three weeks. ICO investigation. GDPR breach. Front page.*

Bylor Engineering - Hinkley Point C

Infrastructure as Code (IaC)

Define an entire environment - servers, networking, access controls - as code. Spin up a perfect replica for DR testing in minutes. One command. Tested. Repeatable. ONR-auditable.

Without orchestration: *DR test fails because the replica was never kept in sync. Real disaster hits. Recovery takes days.*

Ageas Insurance

Automated Deployment & Scaling of Web Applications

Storm Éowyn. 40,000 claims by 6am - twenty times normal volume. Orchestration scales the claims pipeline automatically to meet the spike, then scales back when the queue clears.

Without orchestration: *Pipeline overwhelmed. Claims queue backs up. Customers get no acknowledgement. FCA investigates.*

Lloyds Banking Group

Disaster Recovery & Backup Automation

Failover to a backup region is automatic - defined in code, tested monthly, executed in seconds. No manual runbook. No 3am phone calls. The system already knows what to do.

Without orchestration: *See below.*

⚠ The TSB Warning - Disaster Recovery in Practice

TSB. 2018. A manual, unorchestrated IT migration. The result:

- 1.9 million customers locked out of their accounts
- £330 million in remediation costs
- CEO resigned. FCA investigation. Front page for weeks.

The root cause: no rollback capability, no tested DR plan, no orchestrated failover. With proper orchestration, failover to a backup region is **automatic** - defined in code, tested monthly, executed in seconds. TSB is the lesson the whole UK banking sector carries.

Ofgem - UK Energy Regulator

Automated Compliance Auditing

Every configuration change, every access event, logged automatically. Real-time proof of compliance. The audit trail is always current - the regulator doesn't wait for a quarterly report.

Without orchestration: *Auditor requests 6 months of access logs. Someone has to reconstruct them manually. Gaps found.*

Bylor Engineering - Hinkley Point C	**Multi-Cloud Management**
	Hinkley Point C is a 15-year build. Cloud providers change. Running workloads across AWS and Azure with one control plane means Bylor isn't locked in; and critical data survives provider decisions.

Without orchestration: *Locked into a single provider. Contract changes. Migration mid-project. Cost and risk spiral.*

The pattern is always the same across every sector

Without orchestration	With orchestration	The universal truth
Manual processes. Human error. No rollback. One bad night can become a regulatory incident.	Automated. Self-healing. Policy as code. Tested monthly. Failures are silent recoveries.	It's not a technology choice. It's the difference between reacting to failure and preventing it.
